

Cloud-based endpoint security management service **KDDI Cloud Inventory**

CENTRALLY MANAGE YOUR OVERSEAS IT RESOURCES ON OUR CLOUD

Usable with a wide variety of devices

A wide variety of devices, including PCs, smart devices, to virtual environments, printers, fax/copy machines and foreign devices can all be managed via the Internet, whether the devices are on your company's premises or elsewhere. MDM features for Windows Tablets, such as remote locking and file deletion, are also offered.

Greatly reduce workloads

Our service largely automates security and resource management in place of busy IT system managers. Collected data is used to automatically diagnose devices' security levels, which are shown via gauges. Daily management consists only of checking the security levels shown on the GUI console.

Usable for large-scale, global systems

Due to being cloud-based, an Internet connection is all that is needed to use the service. The service can be flexibly scaled to your needs, from use within only a particular department, to gradual adoption across the whole of your company.

Bypasses complex procedures and delivers results promptly

General Products
